COVID-19 UPDATES

MAY 2, 2023

This page includes East Bay COVID viral levels, testing, vaccine, masking, prevention, treatment and other resources, updated monthly. Please click here to share feedback.

LEAST BAY COVID UPDATES

May 2023

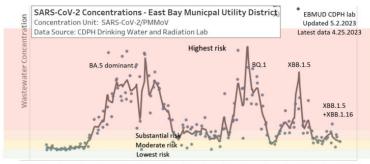

These East Bay Covid updates will be on summer break from June to September 2023, then will be updated as needed with practice-changing updates rather than monthly. Thanks for visiting and reading!

There are still free <u>COVID vaccines</u>, <u>tests</u> and <u>treatment</u> in the East Bay, available to everyone regardless of immigration and insurance status.

- EBMUD wastewater data shows COVID viral concentration briefly rose and fell in April. Predictions are for East Bay COVID levels to increase through May, which may be due to increasing XBB.1.16 variant proportions.
- <u>COVID hospitalizations</u> leveled off in the East Bay and are predicted to stay flat through May.
- Immunity lasts 4-6 months, and bivalent boosters add significant
 additional protection against hospitalization and symptomatic and
 severe infection, so get your updated bivalent booster if you
 haven't yet.

To reduce the risk of respiratory illnesses, we recommend to:

- Stay home and do a home test when sick.
- Gather outdoors instead of indoors when possible.
- When indoors in public and for gatherings: wear high-quality masks, open windows/doors and use air filters to maximize ventilation and/or test before gathering to prevent transmissions.

Click here to read our Wastewater FAQs and @ Feces Facts.

VARIANTS:

- The XBB.1.16 variant is increasing in proportion and is predicted to take over XBB.1.5. As of May 2, 2023, Bay Area variant data shows that the new XBB.1.16 variant is increasing in proportion (~34%), while the XBB.1.5 variant (~41%) is decreasing after dominating from late January to April. Boosters, paxlovid, remdesivir and molnupiravir treatment are still effective against severe disease from XBB1.5 and the newer variants. Read more about East Bay variants here.
- Boosters increase protection against new variants: Recent data show us how immunity against Omicron wanes after 4-6 months and boosters are crucial to protect us against these new variants.

 Vaccine boosters are effective in reducing the risk of long Covid, severe disease and death, especially for people over 65 and those at higher risk.
- Stay healthy by getting the <u>updated booster</u>, wearing N95/KN95/KF94 <u>masks</u> and using rapid <u>tests</u> before gathering and when you have symptoms.

VACCINES:

An updated COVID-19 vaccine helped prevent illness from Omicron XBB-related variants*

Talk to your doctor about gotting an undated COVID-19

- Second bivalent boosters are now authorized for people ages 65+ four months after their first bivalent dose, and for people ages 5+ who are immunocompromised two months after their most recent bivalent dose.
- Vaccination guidelines have been updated:
 - Everyone ages 6+ should get at least 1 bivalent vaccine dose
 (Pfizer or Moderna) to be considered up to date.
 - People ages 65+ may get a 2nd bivalent booster dose at least
 4 months after the first one.
 - People who are moderately or severely immunocompromised may get additional bivalent booster doses at least 2 months after the previous one.
- Get a free updated bivalent booster at local pharmacies, your medical provider, MyTurn.ca.gov, Vaccines.gov, or county sites.
 - When should I get the booster? If it's been...
 - <2-3 months since infection/vaccination: If you are not immunocompromised, wait and plan to get the booster 3-6 months out.
 - 3-6 months since infection/vaccination: Get the booster soon. If you have an event or trip, get it 2-4 weeks before to optimize protection.
 - 6+ months since infection/vaccination: Get the booster ASAP.

BIVALENT VACCINE EFFICACY DATA:

- Infection and hospitalization data finds that the bivalent booster protects against symptomatic and severe disease from the newest variants, including XBB.1.5.
 - Real-world data published in January show that the bivalent booster provided 48% additional protection against symptomatic XBB/1.5 infection compared to no bivalent booster.
 - CDC hospital data through March 2023 shows that people who
 got the bivalent booster had a 6x lower risk of dying from
 COVID-19 compared to those who didn't get vaccinated and
 1.4x lower risk of dying compared to vaccinated people who
 didn't get the bivalent booster.
- Immunity wanes over time, so boosters provide important protection. Updated COVID vaccine efficacy data from the <u>April</u> 2023 CDC ACIP meeting found:
 - Significant waning of vaccine efficacy by 4 months against hospitalization was seen in all age groups: 68% to 27% efficacy from 2 to 4 months in ages 18-64 (compared to

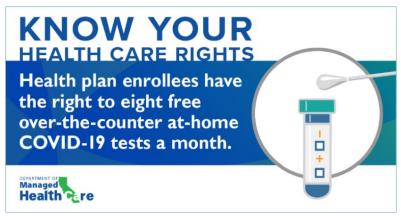

- unvaccinated) and 64% to 53% to 39% efficacy from 2 to 4 to 6 months after vaccination for people ages 65+. (Link-Gelles, slide 13)
- While people who got the bivalent vaccine had lower rates of hospitalization, those who got the monovalent vaccine were further out from the last dose (median of almost a year), which likely also reflects waning over time. (Link-Gelles, slide 13 and CDC vaccine efficacy dashboard)
- Immunocompromised people ages 18+ had lower overall vaccine efficacy: 30% to 43% to 31% efficacy at 2 to 4 to 6 months after vaccination. (Link-Gelles, slide 14).
- Waning was also seen in protection against ventilation or death from 76% to 54% from 6 months to 12 months after vaccination. (Link-Gelles, slide 20)
- On April 10, DHHS and the White House <u>announced</u> the launch of "Project NextGen," investing \$5 billing in next generation Covid vaccinations and treatments, including nasal and pan-coronavirus vaccines.

PREVENTION:

- <u>California isolation and quarantine guidelines</u> were updated on March 13:
 - If you test positive for Covid, isolate for at least 5 days and wear a mask for 10 days.
 - You may leave isolation after 5 days if symptoms are gone or improving and have had no fevers for 24 hours without the use of fever-reducing medications.
 - Wear a mask around others for 10 full days after start of symptoms. If you had no symptoms, wear a mask for 10 full days after your positive test. You may remove your mask sooner than Day 10 if you have two negative tests in a row, at least one day apart.
 - <u>Click here</u> to download the Alameda County isolation PDF. <u>Click here</u> to read more isolation details from Alameda County.
 - If you were exposed and have no symptoms, test immediately and 3-5 days after your last exposure. Wear a mask for 10 days, even at home around others.
- Masks: As of April 3 in California, masks are recommended but not required in indoor high-risk settings, including health care, long-term care, correctional facilities; homeless, emergency and warming and cooling centers. Individual facilities may still choose to make masks required.
 - Masks will remain <u>recommended</u> in public indoor and transit settings when community levels are high (or medium for vulnerable people).
 - Masks are also recommended when exposed to or infected with COVID-19.
 - o If your goal is to prevent infection and long COVID for yourself

and/or people you live with, we recommend following the wastewater levels above or the CDC transmission levels.

TEST-AND-TREAT:

- If you have health insurance in California, you can still get 8 free COVID home tests after the federal public health emergency ends on May 11. Insurance companies will still be required to cover 8 COVID home tests per insured person per month indefinitely. California insurance companies are also required to cover COVID-related costs through any licensed provider without copays, cost-sharing or prior authorizations until November 11, 2023 (a 6 month extension from the federal end thanks to CA Senate Bill 1473). After November 11, 2023, California insurance companies will still be required to cover in-network COVID-related costs. Click for more info about the end of the public health emergency for California residents.
 - For everyone: if you haven't yet requested the 4 free COVID home tests from the federal government since December 19, you can still click here to request them or call 1-800-232-0233.
 - Contra Costa residents can get 4 additional free at-home COVID test kits per household by filling out this online form or by calling 833-829-2626.
 - For people with Medi-Cal, Medicare or private insurance: click here for instructions on how to get free tests through your insurance.
- Are expired COVID home tests still useful? If you still get a clear "control" line, the test is likely to still be effective.
- **COVID test-and-treat**: Paxlovid is still free and widely available!

 Community members at risk can get treatment at the same location and on the same day that you test positive and regardless of insurance or immigration status. Please encourage anyone who tests positive to contact their provider or a free test-and-treat center ASAP, as they may be able to get treatment.
- Free COVID clinical consults for CA clinicians: California health care providers can now call (866) 268-4322 (COVID-CA) to receive free and confidential consultation on COVID-19 testing and treatment from the UCSF National Clinician Consultation Center.
- What are current COVID treatment options?

- Paxlovid, remdesivir and molnupiravir remain effective against the newer variants.
- Viral rebound is common for both treated and untreated people with COVID-19. There is no evidence of resistance to Paxlovid. Treatment still helps reduce viral load and severity. Just make sure to re-isolate.
- How can we prevent long COVID? Aside from wearing masks and preventing infection, the latest data suggests that you can reduce the risk of long COVID if you get infected with:
 - Vaccination with at least 2 doses was associated with a 43% reduction of long COVID in a large systematic review of 41 studies.
 - Paxlovid treatment was found to reduce the risk of long COVID by 26% in a large VA study.
 - Metformin (a safe and inexpensive medication usually used for diabetes) taken for 2 weeks during acute COVID infection was found to reduce long COVID by 42% in a randomized control trial.
 - Ensitrelvir (a protease inhibitor like Paxlovid) taken once a day for 5 days was compared to placebo in a randomized control trial in people at lower risk (mostly ages 12-69, vaccinated, no medical risk factors for severe disease), and was found to reduce long Covid symptoms by 26-45%, shorten symptoms by a day and reduce time to first negative test. This study was also presented at CROI 2023. Ensitrelvir is already approved for COVID treatment in Japan.
 - A "healthy lifestyle" (BMI 18-25, never smoking, exercise, moderate alcohol intake, high quality diet, sleeping 7-9 hours per day) was found in the Nurses' Health Study II cohort (all women, 97% white) to be associated with a lower risk of long COVID. Participants with 5-6 healthy lifestyle factors had 49% lower risk of long COVID.

THE END OF COVID EMERGENCIES:

Free Covid vaccines, testing and treatment will still be available at pharmacies and community partners after the federal public health emergency ends on May 11 under <u>CA law</u>, the national <u>PREP Act</u> and new Bridge Access Program.

- In April 2023, the Department of Health and Human Services
 (DHHS) announced that some of the PREP Act protections for
 Covid vaccines and treatment distributed by the US through
 pharmacies and community partners will continue, including
 pharmacist-administered free vaccines and treatments and the
 national Covid test-to-treat program. The CA Covid test-to-treat
 program through Sesame care is also still available.
- DHHS also announced that they will partner with pharmacies to provide Covid vaccines and treatments such as Paxlovid free-ofcharge to people without insurance coverage in the Bridge Access Program to be launched this fall.

 People with insurance coverage in California will be protected from out-of-pocket charges for Covid testing, vaccines and treatment from any licensed provider until November 11, 2023. After that, California insurance companies will still be required to cover these costs in-network without out-of-pocket charges. Click for more info about the end of the public health emergency for California residents.

California's COVID state of emergency ended on February 28, 2023.

The end of the state emergency has led to the end of extra pandemicera CalFresh benefits and the closure of some COVID testing and treatment sites. It may also impact hospitals' ability to address staffing and space shortages as well as some COVID-related paid medical leave policies. Click for more info about the end of the public health emergency for California residents.

The end of the federal emergency on May 11, 2023 will result in:

- The end of continuous Medi-Cal coverage. Medi-Cal recipients will have to manually renew and prove eligibility again.
- The end of national requirements for insurance to cover COVID-related costs. A CA law (CA Senate Bill 1473) extends this requirement for 6 more months to November 11, 2023, so insurance coverage of home test kits and COVID-related health care costs in California will extend till then.
- The end of requirements for insurance to cover all telehealth services; coverage will vary by state.

Click to read more about: the end of the California state emergency and the end of the federal emergency.

EAST BAY HIV UPDATES

These East Bay HIV updates will be on summer break from June to September 2023, then will be updated as needed with practice-changing updates rather than monthly. Thanks for visiting and reading!

- Check out our new <u>Injectables webpage!</u> You can find the latest East Bay resources and updates on injectable HIV medication and PrEP on this page.
- Injectable Sunlenca (lenacapavir, or LEN) is now available on Medi-Cal and ADAP. Sunlenca is a long-acting injectable HIV medication (capsid inhibitor) taken every 6 months for people who have drug-resistance has been a Medi-Cal pharmacy benefit since March 1 and on the CA ADAP formulary starting April 25, 2023. Prior authorization is required for ADAP coverage due to its high cost.
- The Medi-Cal re-enrollment requirement is back due to the end of pandemic emergency exemptions. Medi-Cal members should update

their information to ensure they receive their Medi-Cal re-enrollment packet. To confirm mailing information is current in Alameda County, please contact Alameda County Social Services Agency online or at (888) 999-4772 to report changes including name, address, phone number, or e-mail address. Reenrollment information started mailing in April. Alameda County Medi-Cal members should receive their packet during the month of their initial enrollment.

• DoxyPEP for sexy peeps! Our new East Bay doxy-PEP resource guide has been posted and will be kept updated as new data, guidance and resources become available.

- The East Bay Rapid ART quick guide has been updated with the latest guidelines and practices. Many thanks to Drs. Doug White and Sunny Lai and the Highland ED and HIV teams for collaborating with us on this guide! GTZ-SF has also recently updated the GTZ-SF Rapid ART guide.
- Do you have new staff who want HIV training? Check out our Quick start guide for new HIV staff with free trainings and East Bay HIV resources recommended for case managers, clinicians, nurses, pharmacists and HIV all care team members.

NEW HIV/STD RESOURCES

updated May 2023

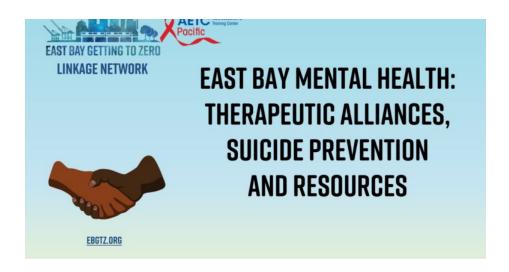

- **Updated national pediatric HIV guidelines** released in April include a shorter course of post-partum AZT prophylaxis (2 weeks instead of 4-6 weeks) for infants born to people living with HIV, and recommendations for shared decision-making around breast/chest-feeding with sustained undetectable viral loads.
- **Updated perinatal HIV data** (here and here; data from 2010-2019) found that the U.S. is approaching the goals set in 2012 for a perinatal HIV transmission rate below 1%, though disparities still persist. Infants born to Black parents have higher rates of HIV diagnosis, and infants born to Latinx parents still have HIV transmission rates higher than 1%.
- Alameda County released a health advisory on xylazine ("tranq"), a veterinary sedative detected in combination with fentanyl and other substances in a rising number of overdose deaths, particularly in the northeastern United States. Click for: more info on xylazine from CDPH, xylazine info and wound care handouts (PDF) in English and Spanish.
- On April 16, 2023, a Penicillin G Benzathine shortage (Bicillin L-A® or "BIC") was announced. ACPHD recommends that Benzathine penicillin G (Bicillin L-A®) is prioritized for treatment of pregnant people infected with or exposed to syphilis and to use alternative treatments for other populations when available. ACPHD also recommends to stick with 2.4 million units of Bicillin L-A® for primary, secondary, and early latent syphilis, since additional doses do not increase efficacy, including among PLWH. The manufacturer anticipates the issue will be resolved in the next two months.
- Increase in extensively drug-resistant (XDR) shigellosis: Alameda County issued a health alert in March on this enteric bacterial infection, which is transmitted fecal-orally person-to-person, including through sex, as well as through contaminated water and food. A huge increase in recent years have disproportionately impacting MSM, PLWH, international travelers and people experiencing homelessness. Test people with more than 3 days of diarrhea and cramping with a stool culture and susceptibility testing.

The 2023 update of the East Bay HIV Strategic Plan in English is ready to read and use! The update includes latest HIV data and 2023 strategic activities. More details are posted on our Strategic Plan webpage. The updated plan in Spanish will be available in May 2023.

Did you miss our **mental health workshop** on March 30? Click here for our guide to East Bay mental health resources and watch the recording.

NEW HIV/STD STUDIES

updated May 2023

Current lists of open Bay Area HIV, hepatitis and COVID studies at UCSF are posted here.

HIV telemedicine visits had better outcomes than in-person visits in a 2022 comparison study at an HIV primary care clinic in Arizona. Patients in the study were given the option for telemedicine or in-person visits. Better performance was seen for those receiving telemedicine visits for visit show rate, medical outcomes (viral load suppression, diagnosis rates), cost-effectiveness, time management, and patient and employee acceptance of the clinics.

The CR0I 2023 conference took place on February 19-22, one of the most important international scientific conferences covering HIV, STIs, mpox, hepatitis and COVID. You can read selected highlights below, our <u>complete highlights here</u>, more summaries on <u>Dr. Paul Sax's CR0I 2023 Really Rapid Review</u> and on <u>NATAP's website</u>.

- **Doxy-PEP**: doxycycline post-exposure prevention for STIs was found again to be effective for MSM and transwomen but <u>not</u> in a group of ciswomen in Kenya. No marked doxycycline <u>resistance</u> has been found yet.
- CAB/RPV (Cabenuva) injectable ART: Thigh injections have drug levels equivalent to gluteal injections. CAB/RPV is highly effective even for people with viremia and adherence challenges and is non-inferior to BIK, but baseline viremia and NNRTI or INSTI resistance are associated with CAB/RPV failures so watch those starting with viremia closely and avoid using it alone with baseline resistance.
- CAB-LA (Apretude) injectable PrEP: there may be some forgiveness with late injections. Failures are rare and can be hard to detect, so get an HIV RNA and Ag/Ab at each injection and quarterly after stopping. Treat people with breakthrough infections with protease-inhibitor-based regimens, such as Symtuza.

Please <u>click here to read our highlights</u> from the updated <u>IAS-USA HIV guidelines</u>.

MPOX (MONKEYPOX) UPDATES

MAY 2, 2023

Jump to:

- East Bay Mpox updates
- How Mpox is spread and how to prevent it
- Mpox vaccine: how to get it in Alameda County and Contra Costa County
- East Bay Mpox epidemiology and links
- Treatment updates
- Mpox resources: fact sheets, videos, references

EAST BAY MPOX UPDATES

Starting June 2023, these East Bay mpox updates will be updated as needed with practice-changing updates rather than monthly. Thanks for visiting and reading!

- Mpox cases have been at zero or very low levels through April 2023 in Alameda County, Contra Costa County,
 California and nationwide after a peak in July/August 2022. As of May 2, 2023, there were no mpox cases reported in Contra Costa County and 3 reported cases in the state of California during the month of April 2023.
- Check out the new Mpox Wastewater Monitoring Dashboard from the national Biobot network. Data from April 2023 shows that 0% of the Western region wastewater sites (including California) had positive mpox detection.
- Mpox in people living with HIV (PLWH) with advanced immunosuppression can be life-threatening. A global mpox study found that mpox can be a disfiguring and life-threatening opportunistic infection, with a mortality rate of 27% among PLWH with CD4 <100. This data presented at CROI 2023 shows how important it is to test and treat HIV early, vaccinate people against mpox, and treat mpox early in PLWH with immunosuppression. This study confirms earlier studies that found PLWH are at higher risk for infection and severe disease, especially PLWH of color and those with low CD4 counts or not on treatment. In addition, presymptomic mpox transmission has been found to be very common (53%), so ensuring vaccine coverage and rapid access to diagnosis and TPOXX treatment continues to be crucial.
- The mpox vaccine found to be highly effective: Another study presented at CROI 2023 found that a 2-dose mpox vaccination campaign reduced mpox incidence by 99%. Data from the UK found that a single dose of the MVA-BN (JYNNEOS) vaccine provided 78% protection against mpox 14 days after vaccination. A second dose offers greater and longer protection. All people in the East Bay getting the mpox vaccine are strongly encouraged to receive both doses of the vaccine.
- Free mpox vaccines are still available in <u>Alameda County</u>, <u>Contra Costa County</u> and throughout <u>California</u>, including 2nd doses. Walk-ins are welcome at many locations.

- Anyone who requests the mpox vaccine should receive it, including women and especially people of color. On
 December 9, ACPHD sent a health alert stating: "providers should offer JYNNEOS vaccine to ANY person who
 may be at risk or believes they may be at risk, and ANY person who requests vaccination should receive it.
 Providers should not require that a person share a reason for wanting vaccination."
- More effort is needed to provide vaccine to: all people living with HIV, MSM, transgender people, people
 w/multiple sex partners and lab/health care workers with exposures, especially people who are Black/African
 American and/or Latinx.

TPOXX (tecovirimat) treatment for severe and/or high-risk mpox illness is available.

- People at high risk include those with weakened immune systems (such as HIV not virally suppressed and/or CD4
 200) and skin conditions (such as eczema).
- Severe disease includes a large number of lesions, involvement of body parts which might result in scarring or strictures, and serious systemic illness such as sepsis, encephalitis and bleeding.
- A CDC study found that in a group of people with mpox, most of the people hospitalized for severe mpox were Black/African American cismen living with HIV and had CD4<200. They experienced had delays in diagnosis and treatment. 12 of the 57 in this group died. This study underscores the importance of mpox vaccination, rapid diagnosis and treatment with TPOXX ASAP for all people with severe mpox symptoms and all people living with HIV with CD4<200.
- In Alameda County, TPOXX may be available at your clinic's pharmacy, the EBAC pharmacy and through the Summit Emergency Department.
- In Contra Costa County, TPOXX is available through the county for people with Medi-Cal and no insurance (call 887-661-6230) or through the BASS ID group for people with Medicare and private insurance (call 925-947-2334).

• Don't forget other STIs:

- Get screened right away for mpox along with other STIs and illnesses if you have symptoms, especially when a
 rash or other symptoms are not getting better.
- A recent study found that 38% of people with mpox had HIV, and 41% had an STI in the preceding year.

HOW MPOX SPREADS AND HOW TO PREVENT IT

- The mpox virus spreads mostly through close, intimate contact with someone who has mpox.
- A large study in the UK found that 53% of mpox transmissions occurred before symptoms started.
- You can take steps to <u>prevent getting mpox</u>, such as through vaccination, and lower your risk during sex.
- CDC recommends vaccination for people who have been exposed to mpox and people who are at higher risk of being exposed to mpox.
- If you've been exposed to someone with mpox, get the vaccine, talk to your healthcare provider and try to avoid close, intimate contact for 16-23 days.
- If you have any <u>symptoms of mpox</u>, talk to your healthcare provider, even if you don't think you had contact with someone who has mpox.
- Providers: be alert for patients who have <u>rashes consistent with</u> <u>mpox</u> and evaluate for mpox along with HIV and other STIs.

Click here for photos of mpox skin rashes (goes to CDC website).

MPOX VACCINE UPDATES

The <u>JYNNEOS vaccine</u> is a live attenuated virus that is considered safe and effective at preventing the onset of disease and severity of illness due to the mpox virus. It is most effective as prevention and within 4 days of exposure but can be given 4-14 days after exposure to help decrease disease severity. Full vaccination requires 2 doses at least 28 days apart and a person is not considered fully vaccinated until 2 weeks after their second dose. Although a 28-day interval is optimal, there is no need to restart or add doses to the vaccine series if the second dose is given after 28 days. As of September 2022, there is adequate supply of the vaccine in the East Bay to give second doses.

WHERE TO GET THE VACCINE IN ALAMEDA COUNTY:

Oakland LGBTO Center: Please click for more information and click here for vax registration.

- Schedule: Walk-ins and appointments for mpox vaccinations will be held weekly on Tuesdays 11-4 pm. Please call 510-781-2639 for more info.
- Location: Directly across from the Oakland LGBTQ Center and the T-Mobile store, at the corner of Lakeshore and Lakeside, beneath the 580 overpass at 533 Lake Park Ave.

Kaiser: Kaiser members who are Alameda County residents who get their care at the Oakland Medical Center can call 510-225-8233. Kaiser members who get their care at Kaiser Fremont and San Leandro can call 510-454-2780.

Other potential vaccine options: please contact your healthcare provider or occupational health department if you are eligible for the mpox vaccine. Click for more options throughout California. If you do not have a healthcare provider, please contact monkeypox@acgov.org.

WHO IS ELIGIBLE IN ALAMEDA COUNTY:

ACPHD recommends that "Mpox vaccine providers should offer JYNNEOS vaccine to ANY person who may be at risk or believes they may be at risk, and ANY person who requests vaccination should receive it. Providers should not require that a person share a reason for wanting vaccination." This includes women and especially people of color, who have faced the biggest gaps in vaccination rates.

In Alameda County during the summer of 2022, although 40% of persons with mpox were Latinx and 25% are Black/African American, only 19% of vaccine recipients were Latinx and 12% Black/African American. It is crucial that we ensure outreach and access for communities of color.

ACPHD recommends intradermal administration as the preferred route of administration of JYNNEOS vaccine. This allows more vaccine doses to be given per vial. Vaccination sites run by Alameda County staff and contractors will allow all minors 12 to 17 years of age to receive the JYNNEOS vaccine without parent/guardian consent.

Second Doses of JYNNEOS

- Second doses of JYNNEOS vaccine should be administered to anyone who received a first dose at least 28 days prior. Although a 28-day interval is optimal, there is no need to restart or add doses to the vaccine series if the second dose is given after 28 days.
- Persons with moderate to severe immunosuppression should receive their second dose no later than 35 days after
- Persons 18 and older who received their first dose subcutaneously may receive a second dose intradermally.
- Persons diagnosed with mpox after their first dose are not recommended to receive the second dose (unless they are immunocompromised), because mpox infection likely confers additional immune protection.

WHERE TO GET THE VACCINE IN CONTRA COSTA COUNTY:

In Contra Costa County, walk-in or schedule your mpox vaccine appointment at locations listed <u>here</u> or call 1-833-829-2626. Click for more options throughout California.

Second doses of the mpox vaccine are available to individuals if it has at least been 28 days since someone got the first dose.

WHO IS ELIGIBLE IN CONTRA COSTA COUNTY

Contra Costa Health (CCH): "recommends vaccination for anyone who thinks they are at risk for an MPX infection (see risk factors below).

For the best protection, people should get two doses of Jynneos vaccine for MPX at least 28 days apart. There are two methods for vaccine injection, intradermal (similar to a TB test) or subcutaneous (a regular shot like you'd get for chickenpox or measles). At county-run vaccination sites, you can choose which injection method you prefer.

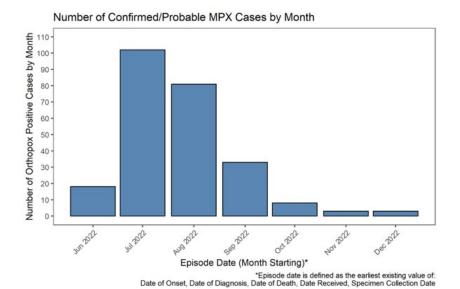

RISK FACTORS

- Sex with multiple partners
- Sex at a commercial sex venue (like a sex club or bathhouse) or at an event
- People who have had close contact with someone with suspected for confirmed MPX
- People taking or prescribed HIV Pre-Exposure Prophylaxis (PrEP)
- People with HIV
- People who have been diagnosed with syphilis or gonorrhea infection in the past 12 months
- People whose sexual partner identifies with any of the above scenarios"

ALAMEDA COUNTY MPOX UPDATES

MPX Case Epidemiological Curve

<u>Click here</u> for the latest Alameda County mpox and other health advisories.

CONTRA COSTA COUNTY MPOX UPDATES

Visit the Contra Costa Health Services Mpox dashboard for the latest updates on local mpox cases. Visit the CDPH mpox page and data dashboard for the latest i+nformation about confirmed or suspected cases of monkeypox in the county.

There may be a reporting delay for most recent 2-3 weeks

Mpox data dashboards: Alameda County | Contra Costa County | California | United States

MPOX TREATMENT UPDATES

Most mpox infections are mild and will heal without treatment.

TPOXX (tecovirimat) treatment is available and should be given without delay to people with severe mpox illness and/or at high-risk.

- People at high risk include those with HIV not virally suppressed and/or CD4<200, other immunocompromising
 conditions, skin conditions (such as eczema), children under 8 years of age, and people who are pregnant or
 breastfeeding.
- Severe disease includes a large number of lesions, involvement of anatomic areas (such as eyes or genitals) which
 might result in serious sequelae that includes scarring or strictures, and serious systemic illness such as sepsis,
 encephalitis and bleeding.
- If you have mpox and want treatment but don't have a medical provider and/or want to participate in a research study, please consider enrolling in the STOMP study at UCSF (call 415-535-9495).
- Clinicians: please see the CDC TPOXX treatment guide and TPOXX investigational new drug (IND) protocol here.
- In Alameda County, TPOXX may be available at your clinic's pharmacy, the EBAC pharmacy and through the Summit Emergency Department.
- In Contra Costa County, TPOXX is available through the county for people with Medi-Cal and no insurance (call 887-661-6230) or through the BASS ID group for people with Medicare and private insurance (call 925-947-2334).

What is Monkeypox? ¿Qué es la viruela del mono?

Monkeypox is a virus that appears as a distinctive rash, and spreads through close contact skin to skin, sex, kissing, and breathing at close range.

La viruela del mono es un virus que se manifiesta como un característico sarpullido y se contagia a través del contacto estrecho de piel a piel, las relaciones sexuales, los besos y la respiración a corta distancia.

How to protect yourself: Cómo puede protegerse:

Cover exposed skin in crowds

Cúbrase la piel expuesta en espacios concurridos

Don't share bedding or clothing

No comparta sábanas ni ropa de vestir

Ask close physical contacts about recent rashes or sores

Pregunte a las personas con las que mantiene un contacto físico estrecho si han tenido sarpullidos o llagas recientemente

Stay aware when traveling to outbreak countries

Esté al tanto si viaja a países donde hay brotes

See a provider right away if you have a rash, or if you have been in contact with someone who has monkeypox. Stay home if you feel sick.

Acuda a un médico de inmediato si le sale un sarpullido o si ha estado en contacto con alguien a quien se le ha diagnosticado la viruela del mono. Quédese en casa si se siente enfermo.

CUALQUIER PERSONA PUEDE CONTRAER LA VIRUELA DEL MONO

Al culpar a una sola comunidad puede dañar los esfuerzos de salud pública y causar que los proveedores de atención médica no detecten la viruela del mono en otra gente.

Gay Sexuality & Social Policy Initiative @ UCLA Luskin gaysexresearch.com

ANYONE CAN GET MONKEYPOX

Blaming any one community may harm public health efforts and cause providers to miss monkeypox in other people.
